

Assignment 1: Movie Watchlist

This project is a Movie Watchlist web application developed using Django and PostgreSQL. It allows users to add, edit, delete, search, and organize movies based on their watched status. Movies can be added manually or imported from TMDB, and watched movies can be given a personal rating from 1 to 5 stars.

1. Homepage Overview

The homepage provides the main functions of the application. Users can add a movie through TMDB or enter a movie manually. The local search bar can also be used to search movies that are already stored in the watchlist by title. Movies are displayed with the newest added movies first.

Plan to Watch Section

The Plan to Watch section contains unwatched movies. Each movie card displays the poster, title, release year, genre, and date added. Users can mark a movie as watched, edit its information, or delete it from the watchlist.

Watched Movies and Personal Rating

The Watched section contains movies that have already been watched. Users can give each movie a personal rating from 1 to 5 stars, clear an existing rating, edit or delete the movie, or use Mark Unwatched to move it back to Plan to Watch.

Add a Movie via TMDb

From the + Add Movie via TMDb button, the TMDb search page allows users to search for movies from The Movie Database. Search results display the movie poster, release year, genre, and TMDb rating. A movie can be added directly to either Plan to Watch or Watched.

Add a Movie Manually

Movies can also be added without using TMDb. The manual form by pressing the Add Movie Manually button allows the user to enter the title, genre, release year, and watched status before saving the movie to the local database.

Adding a Movie to Plan to Watch

After selecting Add to Plan to Watch from the TMDB search results, or adding a movie manually without marking it as watched, the movie is saved to the local database and appears in the Plan to Watch section as an unwatched movie.

Adding a Movie to Watched

A movie can be added to the Watched section in three ways: by selecting Add to Watched from the TMDB search results, by adding a movie manually and marking it as watched, or by selecting Mark Watched for a movie already in Plan to Watch. Once a movie is in the Watched section, the user can give it a personal rating from 1 to 5 stars.

Deleting a Movie

Selecting Delete opens a confirmation page before the movie is permanently removed from the watchlist.

After confirming the deletion, the movie is removed from the database and no longer appears in the watchlist.

Editing an Existing Movie

The screenshot shows a web browser window with the URL `127.0.0.1:8000/movies/12/edit/`. The page has a dark theme and a navigation bar with links for Home, About, and Contact. The main heading is "Edit Movie" with the subtitle "Update the information stored in your local watchlist." Below this is a form with the following fields:

- Title:** A text input field containing "Your Name."
- Genre:** A text input field containing "Animation, Romance, Drama".
- Release year:** A text input field containing "2016".
- Already watched:** A checkbox that is currently unchecked. Below it is a note: "Check this if you have already watched the movie. You can rate watched movies from the watchlist."

At the bottom of the form are two buttons: "Save Changes" (highlighted in red) and "Cancel".

Selecting Edit opens the movie form with its existing information already filled in. After the changes are saved, the updated information is stored in the database and displayed on the homepage.

Local Movie Search

The screenshot shows the homepage of the web application with the URL `127.0.0.1:8000/?q=Inter`. The page has a dark theme and a navigation bar with links for Home, About, and Contact. The main heading is "Keep track of what you plan to watch (unwatched), what you've finished, and how you rated each movie." Below this is a search bar with the text "Inter" and a red "Search" button. The results section is titled "Showing local watchlist results for 'Inter'" and displays a "PLAN TO WATCH" section. The first result is the movie "Interstellar" (2014), which is categorized as "Adventure, Drama, Science Fiction". The movie poster for "Interstellar" is shown.

The homepage search filters movies by title from the local watchlist. In this example, searching for "Inter" returns the matching movie "Interstellar".

2. Django Admin

The Movie model is registered in Django Admin. Movie records stored in PostgreSQL can also be viewed and managed through the Django administration interface.

3. About Page - Project Overview

The About page provides a short overview of the Movie Watchlist and its main features, including watchlist management, watched status, personal ratings, and TMDB integration.

This section lists the main technologies used in the project, including Python, Django, PostgreSQL, Django ORM, HTML, custom CSS, JavaScript, Requests, Git/GitHub, and the TMDB API.

TMDB attribution is also included because movie information and poster images are retrieved through the TMDB API.

The project includes an AI disclosure to acknowledge the use of ChatGPT during development. ChatGPT was used for explanations, planning, code drafting, debugging guidance, security review, and user-interface planning. The suggestions were reviewed, adapted, and tested during development.

4. Contact Page

The Contact page provides the AIT student email, personal email, and a direct link to the GitHub repository for this project.

The complete source code and setup instructions are available in the GitHub repository above.

TMDB API Reference

The Movie Database (TMDB) API was used as the external data source for movie search, movie details, genres, ratings, and poster images in this project. The Django backend communicates with TMDB using an API Read Access Token, while the token remains hidden from the client side.
